Overview

This PDF outlines the conceptual design of our website, including its layout, navigation flow, and key user interactions. The goal is to ensure intuitive usage and a strong branding effect.

Page Layout/Navigation

Our website will have a consistent layout across pages:

- **Header:** Logo, navigation menu
- **Main Content:** Dynamic page data such as events
- **Footer:** Contact, imprint, "Datenschutzerklärung" (privacy policy, will not implement yet)

Navigation Flow for Booking Ticket

Note: This might be changed in the future, but for now, this is the flow for simplicity.

Home → Event Details → Seat Selection → Checkout → Confirmation

User Experience

1. **Homepage:** Shows all upcoming events as interactive cards containing titles, dates, and venues. Users can filter events by category, date, or keywords.
2. **Event Details:** Displays detailed event data and interactive seat map. Seat availability is color-coded (for now: green for available, yellow for reserved, red for sold)
3. **Seat Selection:** Allows users to choose seats directly from a grid. Selected seats temporarily switch to a reserved status until the transaction is confirmed.
4. **Checkout:** Summarizes selected seats and total pricing. After payment, the order is created, and tickets are marked as ticketed.
5. **Confirmation:** After checkout, the user sees a confirmation page and can later review past purchases and refunds in the dashboard.

Page Structure

- **Homepage:** Includes a simple hero banner, search filters, and a grid of events. The grid will be responsive to different screen sizes.
- **Event Details:** Displays event information alongside a seat map. Hovering over seats shows labels and prices.
- **Checkout Page:** Summarizes the selected seats and total price, ensuring seat availability before completing the transaction.
- **Imprint:** Contains contact information and the required legal disclaimer. It's accessible from all pages within one click

The Website

You can find the website under `http://clabsql.clamv.constructor.university/ntaha/`. The website covers the main aspects of what was described in this PDF. In the navbar, there are placeholder menu items, such as "Browse Events", which currently leads to the homepage, and "Create Event", which simply directs to "#". Also, I added login and sign up buttons for the future, but they do not have any functionality as of now. The banner features our color scheme as a background, which can also be found in the CSS file in the variable definition. Furthermore, the banner features a search bar, which of course is also non-functional at the moment. Below that, I added the filtering system, which consists of filtering by date, location, category, and a "More Filters" button, which currently does not do anything. The events grid is also present. In order to showcase it, I wrote a bit of JavaScript code with pre-defined events. The events are then dynamically loaded into the grid. Regarding the CSS, I tried to make it as clean as possible. I added CSS variables, such as `bg-primary`, `bg-secondary`, etc., so that the colors and sizes are consistent throughout the page. For the icons, I used an icon library called "Lucide", so that there is no need for SVG code in the HTML file. The footer contains social media links, and some placeholder menu links, which aren't functional yet. Lastly, the imprint page is accessible from the footer (bottom right) and contains a contact email address, as well as the in the assignment provided legal disclaimer. Lastly, although the website is partially responsive (for the phone), some parts such as the navbar haven't been implemented for the phone yet. This will be fixed in the future.
